

DSA Recap

Mark Holliman

Kevin Benson

Recap

- Install a Data Set Access Component on tomcat
- Configure and point to a mysql database in cambridge
- Query on the DSA in Cambridge
- Register it and view it with another client application such as Astrogrid VODesktop
- Attempt setup and point to other DSA of interest to the installer

Success and Failures

- Failure
 - Access to local laptop from outside services. Making query with Astrogrid VODesktop difficult.
 - Found a manual way of registering (later).
 - Username&Passwords to be kept the same.
 - Couple minor areas in the DSA could have been improved in the workshop to make it easier to install.
- Success
 - Seemed almost everybody did go to the very last step before registration, of having a DSA connected to mysql and able to do a few queries in the DSA component.
 - Couple of people connected their own datasets with the DSA component.
 - Very minor software problems in this session. 'Setting up' session helped.
